Create a simple contact list web app

To demonstrate your technical skills and understanding of web development we ask you to create a simple contact List application.

Please try and implement as many of the requirements below as you can. As a guideline we suggest you spend no more than 2 hrs on this exercise. However if you would like to spend more than 2hrs on the exercise you can.

Requirement 1: The application will show a list of contacts retrieved from
http://jsonplaceholder.typicode.com/users

Requirement 2: When you click on a contact you will be presented with their business card. e.g. Something that looks very similar to this

Requirement 3: Implement a basic search capability.

Requirement 4: Use a build system of your choosing.

Requirement 5: Use a template system of your choosing.

Requirement 6: Create a separate 'admin' section that shows some simple reports:
• How many contacts are there that start with each letter of the alphabet.

Additional requirements:

- Responsive nature, works on various screen sizes.
- 'Busy' indication. I.E. When loading the list
- Sorting options added to list

Hints:
Feel free to use any third party libraries you want.

We value maintainable code
Please send us your own work by email attachment or preferably via a version control tool like bitbucket or Github
